AUTOMATIC QUERY EXPANSION BASED ON A SIMILARITY THESAURUS (INFORMATION RETRIEVAL)

Author: QIU, YONGGANG

Degree: DR.SC.TECH

Year: 1995

Corporate Source/Institution: EIDGENOESSISCHE TECHNISCHE HOCHSCHULE ZUERICH (SWITZERLAND) (0663)

Source: Volume 5702C of Dissertations Abstracts International.

PAGE 321 . 123 PAGES

Location of Reference Copy: SWISS FEDERAL INSTITUTE OF TECHNOLOGY, ZURICH, SWITZERLAND

...structure, called a similarity thesaurus, is constructed automatically and consists of term-term similarities that are based on how the terms of a collection "are **indexed**" by the **documents**. It reflects domain knowledge about the collection and is used to select and weight additional search terms when expanding a query. A query is expanded... terms that are most similar to the concept of the query, rather than by adding terms that are strongly related to one of the original **query terms**. The **added terms** are then weighted according to their similarity to the query concept.

We also present an extended version of the concept-based query expansion model that... bring down the cost of constructing, storing and accessing a similarity thesaurus. In addition, novel algorithms are introduced for constructing and updating a similarity thesaurus.

Retrieval results of experiments on both small and large collections are presented. The **results** indicate that the **retrieval** effectiveness is considerably higher when the concept-based query expansion methods are applied than when using a reference method, and the extended model produces better **retrieval results** than the original expansion model.

For retrieving information from large commercial databases, we developed and implemented a retrieval system, ISIR. ISIR is a very user...

Abstract: ...Having evolved over the last twenty years, these estimations allow us to take both document frequency and within-document frequency into account. We suggest representing **documents** not only by **index** term vectors as proposed by previous probabilistic models but also by considering relevance hypertext links. These relationships, which provide additional evidence on **document content**, are established according to requests and relevance judgments, and may improve the ranking of the **retrieved records**, in a sequence most likely to fulfil user intent. Thus, to enhance retrieval effectiveness, our learning retrieval scheme should modify: (1) the weight assigned to each indexing term, (2) the importance **attached** of each **search term**, and (3) the relationships between documents. Using a simple additive scheme applied after a ranked list of documents has been determined, with the aid of...

Title: Contextual metadata: faceted schemas in virtual library communities

Abstract: ... one user group, public library fiction readers, in order to reveal a design of an online community at the

local level. Examination of user-generated **metadata** can reveal new approaches to information architecture. Design/methodology/approach - A literature review into behaviors of virtual communities; surveying public library readers regarding search behavior characteristics - the survey included a sample "tagging" exercise to determine whether public library communities could create meaningful metadata for retrieval purposes. Findings - The use of relevance as an indicator of tag quality is flawed: in a survey, public library readers "tagged" the novel... .. Research limitations/implications - This research is relevant in the world of social networking sites, online communities, or any other such system where users generate descriptive **metadata**. Examination of such **metadata** can reveal facets, which can guide the architect/librarian in the design of a versatile architecture. Originality/value - This research resulted in a manifold design... .. based online community that allowed for the full expression of users' information needs. This research introduces a faceted structure to current approaches for user-generated **metadata**, adding versatility to search terms.

...are often so large that they end up in storage options that are add-ons to core content management solutions (CMS). Given the lack of **metadata** associated with video content, it's challenging to put video assets on an even playing field with text-based material. Google Mini, Microsoft Search Server, and other enterprise search solutions are effective tools for creating viable indexes out of the most disorganized text-based assets. Since the **searchable terms attached** to video content don't exist in text form, video can't easily be crawled. The result is video content that is inadequately indexed and...

Alerting Abstract ... and representative non-textual data are extracted from a document retrieved from a specific location, and are stored along with location information in a database record. The record is retrieved, based on a document query built from a received search keyword. A search result document is generated using the data from the retrieved database record. ... ADVANTAGE - Enables users to easily and quickly obtain search result document, by the use of the results database that stores document key-word, its non-textual representation and location... Original Publication Data by Authority/ArgentinaPublication No. ...Original Abstracts:are retrieved from the Internet and keywords are extracted from the HTML documents based on the structure of the HTML documents and the HTML documents' metatags. The HTML documents are scanned for representative non-textual content such as images or audio files. The HTML documents' locations, extracted keywords, and representative non-textual content are stored in data records in a database for future use. The database is used to create a search result HTML document containing the representative non-textual content. ...Claims:non-textual data from the document; storing the document location, document keyword, and the representative non-textual data in a results database record; receiving a search keyword; retrieving the results database record based on a document query built from the search keyword; and generating the search result document using the document location and the representative non-textual data extracted from the results database record.

Web site search service system using meta search engine, connects with multiple search engines based on user input search terms, produces search terms similar to user input based on search results **Alerting Abstract** ...NOVELTY - A meta search server (40) connects with multiple search engines (30) to search for required site according to search terms input by user and produces search terms by subjects similar to user input, based on the search results. The search results are automatically classified based on both the search terms, and are output to the user terminal (20) in real-time. ...ADVANTAGE - Since search terms similar to user input are produced, the data required by the user are easily found. Since the search results from diverse search engines are obtained. Original Publication Data by Authority/ArgentinaPublication No. ...Original Abstracts:in real time the search results collected through

numerous dedicated search engines all over the world by using a meta search engine, automatically classifies the **search** results into the **terms** by subjects similar to the **search terms** inputted by **users**, and provides the automatically classified search results to the users. Connection data of plural search engines is built in a database in a meta search server. ... programs of the users of the plural client personal computers, the meta search is carried out with the plural search engines connected according to specified **search terms** inputted by the users of the corresponding **client personal computers**. The **search** results carried in the plural search engines are automatically classified according to the specified **search terms** inputted by the corresponding users and the **terms** by subjects similar to the **search terms** and the automatically classified **search** results according to the specified **search terms** are **outputted** to the corresponding client personal computers. **Accordingly**, in the present invention, search results classified by subjects can be obtained with one-time search for the users to easily find the **search results desired** by the users, so that the preciseness of the search results can be enhanced beyond comparison with existing search engines. ...

detailed Description:

...to a user query. The index database 143 references URLs (Uniform Resource Locator) of documents in the servers 101-103 with information extracted from the documents. The index database 143 may store cached compressed version of the documents 111-1 19. The search query mechanism 144 receives a query request from a client... an index mechanism 403, and a query mechanism 404. The search engine 401 includes an index database 405 for storing indexed data relating to Web documents. The index database 405 includes cached versions 406 of documents. The cached versions 406 of documents may be compressed documents. The search engine 401 of the described... a compression distance calculation mechanism 413, and an author grouping mechanism 414. The document compression mechanism 416 may use the cached compressed versions 406 of documents from the index database 405. The query mechanism 404 includes a selection means 415 for viewing documents by a same author as a returned document. Referring to Figure... selected 502. The candidate pairs including the selected document are generated 503. The document compressions are obtained, which may use the compressed cached version of documents in the search index, and candidate pairs are compressed together 504. The compression distance algorithm is applied 505 to obtain

the compression distance for each candidate pair.

Specification: ...a specified search criteria are returned to one of the users 10 making the search request. The search criteria may consist of combinations of DIA document profile parameters, document model object parameters, folders, and contextual search data. The search criteria may also be enterprise-specific search terms added to a document by an enterprise of related users, i.e., a bank. The input to the SEARCH command includes the libraries to be searched..

Instruction Manual for FOCUS, The National Dropout Prevention Center Database, Version 1.0.

Corporate Source: National Dropout Prevention Center, Clemson, SC.

47 pp.

1990 (19900000)

FOCUS is a database containing dropout prevention information at Clemson University (South Carolina). FOCUS provides access to the following data **files**: (1) Dropout Prevention Program Profiles; (2) Dropout Calendar of Events (National); (3) Dropout Calendar of Events (South Carolina Only); and (4) Dropout Resource Materials Library. The Program Profiles **file** includes information about hundreds of dropout prevention programs currently operating in U.S. schools. The Calendar of Events **files** include information about conferences, seminars, workshops, and meetings related to dropout prevention. FOCUS can be accessed in the following ways: (1) via DORIS (**D**ocument **O**nline **R**etrieval **I**nformation System) by Clemson University campus users; (2) via the CUFAN network by South Carolina users; (3) via Telenet by authorized users nationwide... ..5) general searching instructions; (6) information on Program Profiles records and sample searches; (7) information on Calendar of Events records and sample searches; and (8) **appendixes** covering **search** preparation, suggested **search terms**, **searching** techniques, and topics for searching the Resource Materials Library. Update pages are included. (AF)

An Iterative Browsing Technique. Annual Progress Report. [March 1, 1970 - February 28, 1971.]

Williams, John H., Jr.

Corporate Source: International Business Machines Corp., Gaithersburg, MD. Federal Systems Div.

30 pp.

April 1971 (19710400)

Notes: (3 references)

Sponsoring Agency: Office of Naval Research, Arlington, VA.

Experience of browsing with a text retrieval system is reported. The technique discussed consists of **adding** and deleting **query terms** on successive interactive cycles. The number of hits consistently increased, while the number of false drops consistently decreased on successive cycles. The search system used allows non-Boolean free form query statements. Therefore, an abstract may be used as a query with the objective of finding similar abstracts from the file.
